Surface Water Quality Classes

- A
- AA
- B
- BB
- GC
- GB
- SA

Ground Water Quality Classes

- GA
- GAA
- GB
- GC

EXPLANATION

Surface water quality is determined as the following classes:

- A (Class AA): These areas are located in the main stem of the water body and are considered to be Class A. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- AA: These areas are located in the main stem of the water body and are considered to be Class AA. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- B: These areas are located in the main stem of the water body and are considered to be Class B. These areas are moderately protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- BB: These areas are located in the main stem of the water body and are considered to be Class BB. These areas are moderately protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GC: These areas are located in the main stem of the water body and are considered to be Class GC. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GB: These areas are located in the main stem of the water body and are considered to be Class GB. These areas are moderately protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- SA: These areas are located in the main stem of the water body and are considered to be Class SA. These areas are protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GC: These areas are located in the main stem of the water body and are considered to be Class GC. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GB: These areas are located in the main stem of the water body and are considered to be Class GB. These areas are moderately protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- SA: These areas are located in the main stem of the water body and are considered to be Class SA. These areas are protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

GROUND WATER QUALITY CLASSES

- GA: These areas are located in the main stem of the water body and are considered to be Class GA. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GAA: These areas are located in the main stem of the water body and are considered to be Class GAA. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GB: These areas are located in the main stem of the water body and are considered to be Class GB. These areas are moderately protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- GC: These areas are located in the main stem of the water body and are considered to be Class GC. These areas are highly protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.

- SA: These areas are located in the main stem of the water body and are considered to be Class SA. These areas are protected and are used for all water uses, including drinking water. The data was collected from 1991 to the present.
